

HOW TO CLEAN THE FUEL INJECTION SYSTEM

VENOL INJECTION CLEANER DIESEL is a product designed for effective cleaning of fuel injection systems in diesel engines. The liquid removes carbon deposits from injector nozzles, improving fuel atomization and combustion conditions. Regular use reduces fuel consumption, limits smoke emissions, quiets engine operation, and extends the lifespan of the injection system. The product is suitable for all types of injection systems: injection pumps, unit injectors, and Common Rail injectors.

How to use the injector cleaning additive – 3 methods

1. Prevention – into the fuel tank: Pour the additive directly into a full fuel tank to prevent the buildup of contaminants and keep the injectors in good condition.

2. Directly into the fuel filter: Use when the diesel engine starts to smoke or runs louder. The additive quickly cleans the fuel system and improves engine performance.

3. At reserve fuel level – when the third method is not possible: Pour the additive when the fuel level is very low (reserve) so that the concentration of the product in the system is maximized. It is advisable to replace the fuel filter with a new one before this operation.
